I. Key data on HPV and HPV-related cancers

Mauritius has a population of 552,616 women ages 15 years and older who are at risk of developing cervical cancer. Current estimates indicate that every year 123 women are diagnosed with cervical cancer and 61 die from the disease. Cervical cancer ranks as the 3rd most frequent cancer among women in Mauritius and the 2nd most frequent cancer among women between 15

and 44 years of age. Data is not yet available on the HPV burden in the general population of Mauritius. However, in Eastern Africa, the region Mauritius belongs to, about 4.7% of women in the general population are estimated to harbour cervical HPV-16/18 infection at a given time, and 67.9% of invasive cervical cancers are attributed to HPVs 16 or 18.
